

Team Meeting 13th December 2012

December 13, 2012

1 Questions and Answers

1. Names of strands?
"Complementary strand" is fine, "original strand" is not, try to avoid naming that one.
2. Is there a reason for 60 characters?
No. Number of letters on line should resize dynamically with the window size.
3. Is the anneal score that we used appropriate?
No. Instead, should check for the max number of pairs in a row, and if it's over 4, fail.
4. Is strand identification clear?
Strand layout will be changed. Multiple tabs for one strand, the other, or both.
5. Ross' primer anneal question.
I'll go into it later.
6. Could they provide any example primers?
Yep, we have. Seen below.

2 User Interface Feedback

- Accessibility options should be available, such as larger fonts.
- Size of text should be larger by default anyway.
- Number of characters per line should change dynamically with window size to provide around 500 characters on screen at any time.
- First screen should have some introductory blurb.

3 Primer Annealing

- Primer on complementary strand goes backward, so last should compare to first in other strand and so on.
- Primer dimers?

- Examples of annealing primers provided, good examples to come.
